Goal

程序代写代做 CS编程辅导

Deductive reasoning in language as close as possible to full FOL

$\neg, \wedge, \vee, \exists, \forall$

Knowledge Level:

given KB, α , determine if $\text{KB} \models \alpha$

or given an open $\alpha(x_1, x_2, \dots, x_n)$, find t_1, t_2, \dots, t_n

such that $\text{KB} \models \alpha(t_1, t_2, \dots, t_n)$

When KB is finite $\{\alpha_1, \alpha_2, \dots, \alpha_k\}$

$\text{KB} \models \alpha$

iff $\models [\{\alpha_1 \wedge \alpha_2 \wedge \dots \wedge \alpha_k\} \rightarrow \alpha]$

iff $\text{KB} \cup \{\neg \alpha\}$ is unsatisfiable

iff $\text{KB} \cup \{\neg \alpha\} \models \text{FALSE}$

So want a procedure to test for validity, or satisfiability, or for entailing FALSE.

Clausal Representation

Formula = set of clauses

Clause = set of literals

Literal = atomic sentence or its negation

positive literal and negative literal

positive predicate and negative predicate in FOL

Notation:

- If p is a literal, then \bar{p} is its complement
 $\bar{\bar{p}} \Rightarrow \neg p \quad \neg \bar{p} \Rightarrow p$
 - To distinguish clauses from formulas:
 - [and] for clauses: $[p, \neg r, s]$
 - { and } for formulas: $\{[p, \neg r, s], [p, r, s], [\neg p]\}$
- $[]$ is the empty clause; $\{\}$ is the empty formula
So $\{\}$ is different from $\{[]\}$!

Interpretation:

- Formula understood as *conjunction* of clauses
- Clause understood as *disjunction* of clauses
- Literals understood normally

So:

- $\{[p, \neg q], [r], s]\}$ is a representation of $((p \vee \neg q) \wedge r \wedge s)$
- $[]$ is a representation of FALSE
- $\{\}$ is a representation of TRUE

Resolution Rule of Inference

程序代写代做 CS编程辅导

Given two clauses, infer a new clause:

From clause $\{p\} \cup C_1$
and $\{\neg p\} \cup C_2$,
infer clause $C_1 \cup C_2$.

$C_1 \cup C_2$ is called a *resolvent* of input with respect to p .

Example:

From clauses $[w, p, q]$ and $[w, s, \neg p]$, have $[w, q, s]$ as resolvent wrt p .

Special Case:

$[p]$ and $[\neg p]$ resolve to $[]$

C_1 and C_2 are empty

A *derivation* of a clause c from a set S of clauses is a sequence c_1, c_2, \dots, c_n of clauses, where the last clause $c_n = c$, and for each c_i , either

1. $c_i \in S$, or
2. c_i is a resolvent of two earlier clauses in the derivation

Write: $S \vdash c$ if there is a derivation

Resolution Rule of Inference

程序代写代做 CS编程辅导

- Generalised Resolution Rule

For clauses $\chi \vee \Phi$ and $\neg \psi \vee \zeta$

$\chi \vee \Phi$

$\neg \psi \vee \zeta$

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutores@163.com

QQ: 749389478

<https://tutorcs.com>

- Where θ is a unifier for atomic formulae Φ and ψ
- $\chi \vee \zeta$ is known as the *resolvent*

Rationale

程序代写代做 CS编程辅导

Resolution is a symbol-level rule of inference, but has a connection to knowledge-level logical interpretation.

Resolvent is *entailed* by input clause.

Suppose $I \models (p \vee \alpha)$ and $I \models (\neg p \vee \beta)$.

Case 1: $I \models p$

then $I \models \beta$, so $I \models (\alpha \vee \beta)$.

Case 2: $I \not\models p$

then $I \models \alpha$, so $I \models (\alpha \vee \beta)$.

Either way, $I \models (\alpha \vee \beta)$.

So: $\{(p \vee \alpha), (\neg p \vee \beta)\} \models (\alpha \vee \beta)$.

Special case:

$[p]$ and $[\neg p]$ resolve to $[\]$,

so $\{[p], [\neg p]\} \models \text{FALSE}$

that is: $\{[p], [\neg p]\}$ is unsatisfiable.

Derivations and entailment

Can extend the previous argument to derivations. 程序代码代做 CS编程辅导

If $S \vdash c$ then $S \models c$

Proof: by induction on the length of derivation.

Show (by looking at the two cases) that $S \models c_i$.

But the converse does not hold in general.

Can have $S \models c$ without having $S \vdash c$

Example: $\{\neg p\} \models [\neg p, \neg q]$, i.e., $\neg p \models (\neg p \vee \neg q)$

but no derivation

However, ...

Resolution is sound and complete for propositional logic. Assignment Project Exam Help

Theorem: $S \vdash \Box$ iff $S \models \Box$

Result will carry over to quantified clauses (later)

So for any set S of clauses:

S is unsatisfiable iff $S \vdash \Box$.

Provides method for determining satisfiability:

Search all derivations to see if \Box is produced

Also provides method for determining all entailments

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

The 3 block example

KB = {On(a,b), On(b,c), Green(a), \neg Green(c)}

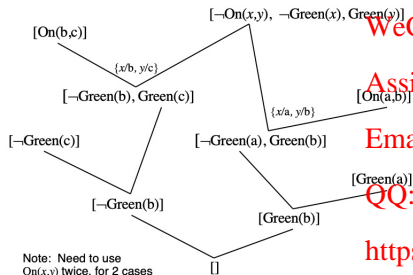

already in CNF

Q = $\exists x \exists y$ [On(x,y) \wedge Green(x) \wedge \neg Green(y)]

Note: \neg Q has no existentials to

yields { \neg On(x,y), \neg Green(x), Green(y)} in CNF

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Note: Need to use
On(x,y) twice, for 2 cases

Arithmetic

KB:

Plus(zero,x,x)

Plus(x,y,z) \rightarrow Plus(succ(x),y,succ(z))

Q: $\exists u$ Plus(2,3,u)

where for readability, we use

0 for zero,

3 for succ(succ(succ(zero))) etc.

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

$[\neg \text{Plus}(x,y,z), \text{Plus}(\text{succ}(x),y,\text{succ}(z))]$

$[\neg \text{Plus}(2,3,u)]$

$[\text{Plus}(0,x,x)]$

$x/1, y/3, u/\text{succ}(v), z/v$

$[\neg \text{Plus}(1,3,v)]$

$x/0, y/3, v/\text{succ}(w), z/w$

$[\neg \text{Plus}(0,3,w)]$

$x/3, w/3$

$[]$

Can find the answer
in the derivation

$u/\text{succ}(\text{succ}(3))$
i.e. $u/5$

Can derive Plus(2,3,5)

Rename variables
to keep them distinct

Answer predicates

In full FOL, have possibility of deriving $\exists x P(x)$ without being able to derive $P(t)$ for any t

e.g. the three-blocks problem

$\exists x \exists y [\text{On}(x,y) \wedge \text{Green}(x)]$

but cannot derive which block

Solution: answer-extraction process

replace query $\exists x P(x)$ by $\exists x [P(x) \wedge A(x)]$,

where A is a new predicate symbol called the *answer predicate*

instead of deriving $[\]$, derive any clause containing just the answer predicate

can always convert a derivation of $[\]$.

Example KB: $\{\text{Student}(\text{john}), \text{Student}(\text{jane}), \text{Happy}(\text{john})\}$

Q: $\exists x [\text{Student}(x) \wedge \text{Happy}(x)]$

QQ: 749389476

<https://tutorcs.com>

A Problem

KB: $LessThan(succ(x), y) \rightarrow LessThan(x, y)$

Q: $LessThan(zero, zero)$

Should fail since $KB \not\models Q$

$[LessThan(x, y), \neg LessThan(succ(x), y)]$

Infinite branch of resolvents

cannot use a simple depth-first procedure to search for []

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

cannot use a simple depth-first procedure to search for []

Undecidability

Is there a way to detect when this happens?

No! FOL is very powerful

- can be used as a full programming language
- just as there is no way to know in general when a program is looping

There can be no procedure that can do this:

Proc[Clauses] =

If Clauses are unsatisfiable

then return YES

else return NO

However: Resolution is complete some branch will contain [], for unsat clauses

So breadth-first search guaranteed to find []
search may not terminate on satisfiable clauses

QQ: 749389476

<https://tutorcs.com>

Overly specific unifiers

程序代写代做 CS编程辅导

In general, no way to guarantee efficient termination

later: put control into users' hands

One major way:

reduce redundancy in search, by keeping search as general as possible

Example:

$\dots, P(g(x), f(x), z) \quad [\neg P(y, f(w), a), \dots]$

unified by

$\theta_1 = \{x/b, y/g(b), z/a, w/b\}$ gives $P(g(b), f(b), a)$

and by

$\theta_2 = \{x/f(z), y/g(f(z)), z/a, w/f(z)\}$ gives $P(g(f(z)), f(f(z)), a)$.

Might not be able to derive [] from clauses having overly specific substitutions
wastes time in search!

<https://tutorcs.com>

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

Most general unifiers

θ is a most general unifier of literals l_1 and l_2 iff

1. θ unifies l_1 and l_2

2. for any other unifier θ' , there is another unifier θ^* such that $\theta' = \theta\theta^*$

note: composition $\theta\theta^*$ requires θ^* to terms in θ

for previous example, an MGU

$$\theta = \{x/w, y/g(w), z/a\}$$

for which

$$\theta_1 = \theta\{w/b\}$$

$$\theta_2 = \theta\{w/f(z)\}$$

WeChat: cstutorcs

Theorem: Can limit search to MGUs only without loss of completeness (with certain caveats)

Computing an MGU, given a set of lits $\{l_i\}$

1. Start with $\theta = \{\}$.

2. If all the $l_i\theta$ are identical, then done; otherwise, get disagreement set, DS

e.g. $P(a, f(a, g(z)), \dots)$ $P(a, f(a, u), \dots)$ disagreement set, $DS = \{u, g(z)\}$

3. Find a variable $v \in DS$, and a term $t \in DS$ not containing v . If not, fail.

4. $\theta = \theta\{v/t\}$

5. Go to 2

Note: there is a better linear algorithm

程序代写代做 CS编程辅导

Assignment Project Exam Help

Herbrand Theorem

Some 1st-order cases can be handled by converting them to a propositional form

Given a set of clauses S

- the Herbrand universe of S is the set of all terms formed using only the function symbols (and constants, at least one) in S
for example, if S uses (unary) function symbols c, d ,
 $U = \{c, d, f(c), f(d), f(f(c)), f(f(d)), f(f(f(c))), \dots\}$

- the Herbrand base of S is $\{c\theta \mid c \in S \text{ and } \theta \text{ replaces the variables in } c \text{ by terms from the Herbrand universe}\}$

Theorem: S is satisfiable iff Herbrand base is (applies to Horn clauses also)

Herbrand base has no variables, and so is essentially propositional, though usually infinite

- finite, when Herbrand universe is finite
can use propositional methods (guaranteed to terminate)
- sometimes other “type” restrictions can be used to keep the Herbrand base finite
include $f(t)$ only if t is the correct type

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutores@163.com

QQ: 749389476

https://tutorcs.com

Resolution is difficult!

First-order resolution is not guaranteed to terminate.

What can be said about the propositional case?

程序代写代做 CS编程辅导

- Recently shown by Haken that there are unsatisfiable clauses $\{c_1, c_2, \dots, c_n\}$ such that the shortest derivation of \perp contains order of 2^n clauses
- Even if we could always find a satisfying assignment immediately, the most clever search procedure will still require exponential time or more problems

Problem just with resolution?

WeChat: cstutorcs

- Probably not.
- Determining if set of clauses is satisfiable shown by Cook to be NP-complete
 - no easier than an extremely large variety of computational tasks
 - any search task where what is searched for can be verified in polynomial time can be recast as a satisfiability problem

Assignment Project Exam Help

Email: tutors@163.com

QQ: 749389476

https://tutors.com

...

- Satisfiability is strongly believed

Implications for KR

Problem: want to produce entailments of KB as needed for immediate action

- full theorem-proving may be too difficult for KR!
- need to consider other options
 - giving control to user
 - procedural representation
 - less expressive languages
 - e.g. Horn clauses (and a major theme later)

In some applications, it is reasonable to wait

- e.g. mathematical theorem proving, where we only care about specific formula

Best to hope for in general: reduce redundancy

- refinements to resolution to improve search

Main example: MGU, as before

- but many other possibilities
 - need to be careful to preserve completeness
- ATP: automated theorem proving
 - area that studies strategies for proving difficult theorems
 - main application: mathematics, but relevance also to KR

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Strategies

1. Clause elimination

- pure clause

contains literal / such that it appear in any other clause
clause cannot lead to []

- tautology

clause with a literal and its negation
any path to [] can bypass tautology

- subsumed clause

a clause such that one with a subset of its literals is already present
path to [] need only pass through short clause
can be generalized to allow

程序代写代做 CS编程辅导

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

2. Ordering strategies

many possible ways to order search, but best and simplest is

- unit preference

prefer to resolve unit clauses first

Why? Given unit clause and another clause, resolvent is a smaller one $\leftarrow []$

Strategies 2

3. Set of support

- KB is usually satisfiable, so not very useful to resolve among clauses with only ancestors in KB
- contradiction arises from interaction of clause $\neg Q$ with clause P that has an ancestor in $\neg Q$
- always resolve with at least one clause that has an ancestor in $\neg Q$
- preserves completeness (some)

程序代写代做 CS编程辅导

4. Connection graph

- pre-compute all possible unifications
- build a graph with edges between any two unifiable literals of opposite polarity
label edge with MGU
- Resolution procedure:
repeatedly:
select link
compute resolvent
inherit links from parents after substitution
- Resolution as search:
find sequence of links L_1, L_2, \dots producing \square

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Strategies 3

5. Special treatment for equality

程序代写代做 CS编程辅导

- instead of using axioms for $=$, use symmetry, transitivity, substitution of equals for equals
- use new inference rule: param
- from $\{(t = s)\} \cup C_1$ and $\{P(\dots)\} \cup C_2$ where $t\theta = t'\theta$
- infer $\{P(\dots s \dots)\}\theta \cup C_1\theta \cup C_2\theta$.
- collapses many resolution steps into one, see also: theory resolution (later)

WeChat: cstutorcs

6. Sorted logic

Assignment Project Exam Help

- terms get sorts:
 $x:\text{Male} \quad \text{mother}:[\text{Person} \rightarrow \text{Female}]$
- keep taxonomy of sorts
- refuse to unify $P(s)$ with $P(t)$ unless sorts are compatible
- assumes only “meaningful” paths will lead to []

Email: tutorcs@163.com

QQ: 749389476

https://tutorcs.com

Finally ...

7. Directional connectives

- given $[\neg p, q]$, can interpret as either

from p , infer q

to prove q , prove p

procedural reading of \rightarrow

forward)

backward)

- In 1st case:

would only resolve $[\neg p, q]$ with $[p, \dots]$ producing $[q, \dots]$

- In 2nd case:

would only resolve $[\neg p, q]$ with $[\neg q, \dots]$ producing $[\neg p, \dots]$

- Intended application:

forward: $\text{Battleship}(x) \rightarrow \text{Gray}(x)$

do not want to try to prove something is gray by proving it is a battleship

backward: $\text{Human}(x) \rightarrow \text{Has}(x, \text{spleen})$

do not want to conclude from someone being human,
that she has each property

- the basis for the procedural representations
